

Superstore Advanced Analytics: Business Insights and Recommendations Report

By: Belinda Thando Mhlanga

Executive Overview

The Superstore generated a total of **\$2.30 million** in sales and **\$286,400** in total profit across **5,009** distinct orders. While the overall business maintains a baseline profit margin of **12.47%**, advanced data analysis reveals critical inefficiencies in discount structures, regional pricing, and specific product lines that are actively destroying company value.

Part 1: Key Business Insights

Based on a deeper investigation of the dataset, the following five critical business insights have been identified:

1. Severe Profit Erosion from Deep Discounting

There is an inverse relationship between discount size and profitability. Orders with no discount generate a highly healthy 29.5% profit margin. However, orders discounted between 21% and 50% resulted in a net loss of **-\$58,817**, and orders discounted over 50% resulted in a net loss of **-\$76,559**. Deep discounting is the single largest threat to the company's bottom line.

2. The Central Region Liability

The Central region is significantly underperforming compared to the rest of the business. Despite generating over \$501,000 in sales, it only produced \$39,706 in profit (a meager 7.9% margin). This is directly driven by an excessive average discount rate of 24% in the region.

3. State-Level Failures (Texas & Illinois)

Within the struggling Central region, Texas and Illinois are massive liabilities. Texas is the worst-performing state in the entire company, generating a **-\$25,729** net loss due to an unsustainable 37% average discount rate. Illinois follows closely behind with a **-\$12,607** loss driven by a 39% average discount rate.

4. Structural Losses in the "Tables" Sub-Category

Not all product categories respond well to the company's pricing strategy. The **Tables** sub-category is actively draining profits. Despite moving over \$206,000 in sales volume, this specific sub-category resulted in a net loss of **-\$17,725**. The margins on tables are too thin to support the company's current promotional strategies.

5. High-Impact Seasonality

Sales volume is highly predictable and heavily skewed toward the fourth quarter. Sales consistently surge in November and December (peaking at \$118,447 in November 2017) and experience a severe "slump" in the first quarter (dropping as low as \$4,519 in February 2014).

Part 2: Actionable Recommendations

To address the identified problems and capitalize on business opportunities, management should immediately implement the following five evidence-based actions:

1. Implement a Strict 20% Discount Cap:

Management must immediately restrict discretionary discounting. The data proves that any discount exceeding 20% reliably results in net losses. A hard cap of 20% should be enforced across all regions and categories.

2. Suspend Discounts in Texas and Illinois:

All promotions and discount codes must be instantly suspended in Texas and Illinois until a full pricing audit is completed. These states are effectively paying customers to take inventory.

3. Conduct a Supply Chain Audit on "Tables":

The company must urgently investigate the supply chain, storage, and shipping costs associated with the Tables sub-category. If the base cost cannot be lowered or the retail price cannot be raised to achieve profitability, the company should consider discontinuing heavy table sales.

4. Delist Worst-Performing Products:

The company must immediately discontinue the *Cubify CubeX 3D Printer (Double Head and Triple Head)* lines. These specific products are the largest drains on profitability at the individual item level, losing over \$12,700 combined.

5. Optimize Seasonal Marketing Budgets:

Because Q4 drives the vast majority of revenue, marketing budgets and inventory stockpiling should be heavily front-loaded into October to capture the November/December surge. Conversely, targeted retention campaigns should be launched in February to stabilize cash flow during the historical Q1 slump.
